This report is restricted to Gaslifting in the Penal Field in Trintec.

The methods of analysis of this field performance is based on quantitative treatments of the wells using field data, well data, sonologs, well head charts and production logs where possible.

The methods of analysis are based on techniques recommended by Kermit E. Brown and T. E. W. Nind (See References).

Consequently, the derived values could be compared with the actual values to determine the efficiency of the gaslift installations.

Finally, suggestions are made to improve the system so as to make gaslifting play a more active role in Trintec's production.
